AI-generated summaries for faster, clearer interpretation and quicker decision-making.

The performance for 2024 is **68.75**, with a **median of 76.23** and an **interquartile range** of 55.1. The median is higher than the average, suggesting a **left-skewed** distribution where lower-performing countries may be pulling the average down. The chart indicates a **substantial spread** in country performances ⁴.

Over the years, the average performance has **increased steadily**: from 26.08 in 2021, rising to 55.42 in 2022, and reaching 68.75 in 2024 for the unmatched cohort ⁵. This shows a clear **improvement** in performance over time.

When comparing the **matched cohort** (countries with data for both 2023 and 2024), the average performance is lower than the unmatched cohort's 68.75, but still shows an increase from 73.37 in 2023 to 76.23 in 2024. This indicates that while overall performance is rising, the improvement is more pronounced among countries with continuous data, possibly due to differences in performance volatility within this group.
